                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                184 cggcggcggccggcggaggcggcccgggggtcccggcggctctggg
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/672,211
FILING DATE: 27-210-1996
CLASSIETCATION: 514
ATTORNEY/AGENT INFORMATION:
NAME: Halluin, Albert P.
REGISTRATION NUMBER: 8549-0005-999
TELECOMMUNICATION INFORMATION:
TELEPRATION NUMBER: 8549-0005-999
TELECOMMUNICATION INFORMATION:
TELEPRATION INFORMATION:
TELEPRATION INFORMATION:
TELEPRATION FOR SEQ 1D NO: 1:
SEQUENCE CHARACTERISTICS:
LENGTH: 4692 Dase pairs
TYPE: nucleic acid
STRANDEDNESS: Single

The invention relates to a protein tyrosine kinase substrate LAT (linker for activation of reals) protein. Modulation of interaction between LAT and the T-cell receptor (TCN) affects the TCR signalling pathway. LAT is a substrate for tyrosine kinases and becomes phosphorylated after TCR engagement, resulting in recruitment of other signalling molecules. LAT is used to identify and test (art)agonists of tyrosine kinase signalling pathways. i.e. modulation of interaction between tyrosine kinase signalling pathways. i.e. modulation of interaction between these ligands and other members of the pathway, including identification of downstream signalling proteins, particularly in immune system cells. These modulators are potentially useful as drugs and diagnostic agents, particularly for diseases that involve undesirable cell proliferation, differentiation, diseases that involve undesirable cell proliferation, differentiation, alleray, microbial infection, mechanism inflammation, hypersensitivity, alleray, microbial infection, mechanism inflammation, hypersensitivity, are trajection of LAT. Nucleic acid that encodes LAT or its fragments, are used to identify homologous sequences in other species; to detect the control of th potentially more specific and less toxic than known immunosuppressants such as cyclosporin. The present sequence represents the nucleotide 12A; 125pp; English human Cbl Disclosure; Fig sednence $\overset{\alpha}{\times}\overset{\times}{\times}\overset{\circ}{\circ}{\circ}\overset{\circ}$

This sequence represents a gene encoding a subunit of the cellulose synthase complex of Vigna angularis. The invention relates to subunits cellulose synthetic equipment, that can be used to increase the amount cellulose synthesised by a plant. The proteins and genes encoding them can also be used to improve the properties of the cellulose being produced by a plant. gatotgactggottatgtgaaccaactccccaagaccatatcaaagtgacccaggaacaa 1249 1370 tggcaggaatcagaaggtcagggctgtcctttctgccgatgtgaaattaaaggtactgaa 1429 the improvement ctgcagctctactgggccatggactccacatttgagctctgcaagatctgtgctgagagc aacaaggatgigaagattgagccgtgcgggcacctgctctgcagctgctgcctggctgc gataaggatgtaaagattgagccctgtggacacctcatgtgcacatcctgtctacatcc tggcagcactcggacagccagacctgcccttctgccgctgcgatcaaggctgggag tatgaattatactgtgagatgggctccacattccaactatgtaaaatatgtgctgaaaat Sequence 10732 BP; 3149 A; 1212 C; 2074 G; 2046 T; 2251 other; ds. cellulose production; increase yield; equipment - for a in a plant body Gene encoding a subunit of cellulose synthase. ```
This is the DNA sequence of the Mycobacterium smegmatis embCAB operon, which determines resistance to the antimycobacterial drug chambulot (FMB). It includes the embA, embC and embD genes that encode proteins (see W13052-64) which are the trarget of action of M. smegmatis for EMB. To identify genes conferring EMB resistance, a genomic library from a high level EMB-resistant mutant of M. smegmatis was introduced into wild-type M. smegmatis mc2155. Four overlapping cosnids were identified which conferred a resistant phenotype. The minimum size fragment capable of conferring EMB resistance was 9 kD (plIMM9). plMM99 plus 7 kD upstream M. Smegmatis sequence was dequences revelaing 3 homologous open reading frames (embC, embB, embB) and 4 additional potential coding regions. Wild-type and mutated embCAB nucleic acid sequences are useful as probes used in the diagnosis of drug-resistant mycobacteria to to determine the susceptibility of mycobacteria to EMB. The nucleic acids are also useful in the treatment of mycobacterial infections; anti-DNA or anti-RNA sequences can be administered to inhibit embCAB operon mRNA activity (claimed). The invention additionally provides for the use of embCAM operon models acid sequences as vaccines, or to improve existing
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Wild type and mutated sequences of Mycobacterium embCAB operon useful to e.g..identify ethambutol-resistant mycobacterial strains and produce antisense sequences to treat mycobacterial infections

The specification describes antisense oligonucleotides (X52869-X55271)
directed against at least 2 mRNAs selected from target genes, coding and
non-coding regions of RNAs corresponding to target genes, gene
initiation codons, genomic flanking regions, intron-exon borders, the
initiation codons, genomic flanking regions, intron-exon borders, the
5'-end, the 3'-end and the juxta section between coding and non-coding
regions and all segments of RNAs encoding proteins associated with one
or more diseases, conditions or mixtures. The antisense oligonucleotides
oligonucleotides (specifically X55180-74. These multiple target
treatment of diseases and conditions. Typical diseases and conditions
are those associated with impaired respiration and inflammation,
allergic rhinitis, acute asthma, allergies, asthma, impeded respiration,
allergiatory disfress syndrome, pain, cyptic fibrosis, pulmonary
pypertension, pulmonary vasoconstriction, emphysema, chronic obstructive
bulmonary disease (COPD), and cancers such as leukemias, lymphomas,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               acute asthma, allergy; asthma; impeded respiration; respiratory distress syndrome; pain; cystic fibrosis; pulmonary hypertension; pulmonary vasoconstriction; emphysema; chronic obstructive pulmonary disease; leukemia; lymphoma; carcinoma; colon cancer; breast cancer; lung cancer; pancreatic cancer; hepatocellular carcinoma; kidney cancer; melanoma; hepatic metastasis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New antisense oligonucleotides used in treatment of, e.g. pulmonary vasoconstriction

This is contig 004 from the recombinant cosmid pKOSO23-27 DNA sequence (see 256001) which contains a Streptomyces venezuelae DNA insert. The cosmid contains open reading frames which encode the various modules of the narbonolide polyketide synthase (PKS). The invention relates to che narbonolide polyketide synthase (PKS). The invention relates to common sequence for a narbonolide PKS.

CC recombinant DNA containing a coding sequence for a narbonolide PKS.

CC condensations and subsequence for a narbonolide PKS.

CC responsible for the production of many antiblotics including picromycin. The narbonolide PKS consists of a loading modile, six extender modules.

CC And two thiocaster domains. Four proteins make up the narbonolide PKS consists of a loading module with a strender modules and extender modules and PCAIN. PICAI includes the loading module of PICAII includes extender modules 3 and PCAIN includes extender module 6 and a type II thiocasterase domain. The second type II thiocasterase domain. The second type II thiocasterase domain. The second type II thiocasterase domain. The nucleotide sequences encoding all of these proteins can be isolated in recombinant form from the recombinant cosmid pKOSO23-27. The recombinant form from from the recombinant cosmid pKOSO23-27. The recombinant DNA of the invention is used to cosmid pKOSO3-27. The recombinant DNA of the invention is used to cosmid pKOSO3-27. The recombinant phospide (or its derivatives) or other ketolides (particularly hybrids), which may then be converted (e.g. by cother enzymes recombinantly expressed in the same hosts) to polyketide antibiolides or their intermediates. The antibiotics are useful in human contains and the decombinant processed in the same hosts) to polyketide antibiotics or their intermediates. The antibiotics are useful in human contains the particularly hybrids in the particularly in the particular or their intermediates. The antibiotics are useful in human can be a converted to the particular or their encymes and the particular or

Desosamine and macrolide biosynthetic gene clusters, useful for, e .g. synthesis of methymycin and pikromycin -

Claim 3; Page 362; 438pp; English.

The invention relates to an isolated and purified nucleic acid segment comprising a desosamine biosynthetic gene cluster, a fragment or its biologically active variant, where the nucleic acid sequence is not derived from the eryC gene cluster of Saccharopolyspora erythraea or Streptomyces antibioticus. The invention also relates to a macrolide biosynthetic gene cluster, or fragments thereof. The macrolide biosynthetic gene cluster encodes proteins which synthesise methymycin, pixromycin, neomethymycin, narbomycin or a combination of these compounds. Recombinant or augmented cells comprising the desosamine and/or macrolide biosynthetic gene clusters are useful for the production of biologically active macrolides. The macrolides biosynthetic proteins are useful for synthesis of methymycin, pixromycin, neomethymycin and narbomycin. The alternative termination of polyketide synthesis may be useful to prepare novel antibiotics and polyhydroxyalkanoate (PHA) monomers. The compounds produced by the recombinant host cells are useful as biopolymers, e.g., in packaging or blomedical applications, to

```
ó
engineer PHA monomer synthases or to prepare biologically active agents, such as chemotherapeutics, immunosuppresants, agents to treat asthma, chronic obstructive pulmonary disease as well as other diseases involving respiratory inflammation, cholesterol-lowering agents or macrolide-based bacteria, including multi-drug resistant preumococci and other respiratory pathogens, as well as viral parasitic pathogens, or as crop protection agents (e.g., fungicides or insecticides) via expression of polyketides in plants. Sequences 287286-287294 represent desosamine biosynthetic genes from Streptomyces venezuelae AICC 15439, which encode proteering y77181-Y77189.
                                                                                                                                                                                                                                                                                                                      1125 CCGCTCGGCCATTCGCGCACGGCGTCGATCACCCCCAGCGCCTGCGGGCGCCCCCAGGTG 1066

This is contig 003 from the recombinant cosmid pROS023-27 DNA sequence (see 256001) which contains a Streptomyces venezuelae DNA insert. The commination comparing frames which encode the various modules of the narbonolide polyketide synthase (PKS). The invention relates to crecambinant DNA containing a coding sequence for a narbonolide PKS.

Polyketides are compounds synthasised from 2-carbon units through a series of condensations and subsequent modifications. Modular PKSs are responsible for the production of many antibiotics including picromycin. The narbonolide PKS consists of a loading module, six extender modules, and two thioester domains. Four proteins make up the narbonolide PKS consists of a loading module, six extender modules of PCAIII includes extender modules and 4, produit includes extender module 5 and 4 produit includes extender module 5 and a type II thioesterase domain. The second type II thioesterase domain. The second type II thioesterase domain cosmid pKOS03-27. Narbonolide is desosaminylated in S. venezuelae to yield narbomyciú, the desosaminyl transferase enzyme is required for this convertson, and the desosaminyl blosynthetic genes are also found in cosmid pKOS03-27. The recombinant DNA of the invention is used to express, in transformed cells, narbonolide (or its derivatives) or other ketolides (particularily hypitals), which may then be converted (e.g. by other enzymes recombinantly expressed in the same hosts) to polyketide antibiotics or their intermediates. The antibiotics are useful in human continued the second pKOSO3-27.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      3247 COGCICGGCCCATICGCGCACGGCGTCGATCACCCGCAGCGCCTGCGGGGCGCTCCAGGIG 3188

The invention relates to an isolated and purified nucleic acid segment comprising a desosamine biosynthetic gene cluster, a fragment or its biologically active variant, where the nucleic acid sequence is not derived from the eryC gene cluster of Saccharopolyspora erythraea or Streptomyces antibioticus. The invention also relates to a macrolide biosynthetic gene cluster, or fragments thereof. The macrolide compounds. Recombinant or augmented cells comprising the desosamine compounds. Recombinant or augmented cells comprising the desosamine of biologically active macrolides. The macrolide biosynthetic gene clusters are useful for the production of biologically active macrolides. The macrolide biosynthetic proteins are useful to repare novel antibiotics and polyNdroxyalkanoate (PHA) arbomycin. The alternative termination of polyKetide synthesis may be useful to prepare novel antibiotics and polyNdroxyalkanoate (PHA) monomers. The compounds practoded by the recombinant host cells are useful as blopolymers, e.g., in packaging or biomedical applications, to engineer PHA monomer synthases or to prepare biologically active agents, such as chemotherapeutics, immunosuppressants, agents to treat asthma, chronic obstructive pulmonary disease as well as other diseases involving respiratory pathogens, as well as viral parasitic pathogens, or as crop protection agents (e.g., fundalides a viral parasitic pathogens, or as crop protection agents (e.g., fundalides or insecticides) via expression of polyketides in plants. The present sequence represents the desosamine biosynthetic gene cluster from Streptomyces venezuelae ATCC 15439.
                                                                                                                                                                                                    Desosamine biosynthesis; macrolide; polyketide; methymycin; pikromycin; neomethymycin; narbomycin; polyhydroxyalkanoate monomer synthase; biopolymer; antibiotic; chemotherapeutic; immunosuppressant; asthma, chronic obstructive pulmonary disease; respiratory inflammation; hypercholesterolaemia; crop protection agent; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             į.

comprising a descamine biosynthetic gene cluster, a fragment or its biologically active variant, where the nucleic acid sequence is not derived from the error gene cluster of Saccharopolyspora erythraea or Streptomyces antibioticus. The invention also relates to a macrolide biosynthetic gene cluster acroades proteins which synthesise methymycin, playsynthetic gene cluster acroades proteins which synthesise methymycin, playsynthetic gene cluster acroades proteins which synthesise methymycin, playsophically active macrolides is are useful for macrolide biosynthetic gene clusters are useful for the production of biologically active macrolides. The macrolide biosynthetic proteins are useful for synthesis of methymycin, playsophic synthesis of methymycin, playsophic synthesis may be useful to prepare novel antibiotics and polyhydroxyalkanoate (PRA) monomers. The compounds produced by the recombinant host cells are useful as bipolymers, e.g., in packaging or biomedical applications, to angineer PRA monomer synthases or to prepare biologically active agents, such as chemotherapeutics, immunosuppressants, agents to treat asthma, circular planmation, cholesterol-lowering agents or macrolide-based artibiotics which are active against a variety of organisms, e.g., chronic obstructive pulmonary disease as well as other diseases involving respiratory inflammation, cholesterol-lowering agents or macrolide-based antibiotics which are active against a variety of organisms, e.g., bacteria, including multi-drug resistant pneumococci and other acceptratory pathogens, as well as virtal parasitic pathogens, or as crop protection agents (e.g., fungicides or insecticides) via expression of protection agents or mercricides or insecticides) and other protection agents or protection agents or mercricides or insecticides) and other protection agents or protection agents or mercricides or insecticides) and other protection agents or mercricides or insecticides) and other process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        osynthetic gene cluster (pik) from Streptomyces venezuelae ATCC 439, as given in figure 32.

Specifically, decreasing the lavels of FIP348-727 prevents apoptosis. This is useful in cells which are dying prematurely, eg: Alzhelmer's disease, Acquired Immune Deficiency Syndrome (AIDS), muscular dystrophy, amyotrophic lateral sclerosis (and other muscle wasting diseases), autoimmune diseases, and diseases where cells are infected with a pathogen (virus, bacteria; fungus, mycoplasm or protozoa). Increasing the levels of FIP 348-727 induces apoptosis which is useful in cells suffering from reoplastas, dysplasias, hyperplasias, or their symptoms. Purified and isolated FIP subgenomic polynucleotides are useful as primers to obtain more copies of the nucleotides, and as

probes that identify wild-type or mutant coding sequences. They are also useful for expressing FTP MRNA, proteins or fusion proteins, and in the generation of FIP antisense oligonucleotides and ribozymes. They are also useful in expression constructs and in gene delivery vehicles (optionally in combination with a condensing agent) that deliver FIP mRNA or oligonucleotides, FIP proteins (including variants), FIP-specific ribozymes or single-chain antibodies into eukaryotic cells. This is the human FADD protein gene. Human FIP protein binds to amino acids 1-110 of the human FADD protein given in W96154.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /note = "Encodes N-terminal half, inducing apoptosis but not binding Fas receptor"

The sequence encodes FADD (Fas-associating protein with novel death domain), which binds the cytoplasmic region of a Fas receptor, and modulates apoptorsis induced by activation of the receptor by ligand binding. The CDNA has been isolated using a yeast two-hybrid system which screens for proteins interacting with the Fas cytoplasmic domain. A GAL4-DNA-binding domain has been fined to the human Fas antigen cytoplasmic tail to form a bait plasmid, which is used with a prey plasmid, containing a human B-lymphocyte cDNA library fused to the GAL4-activation domain, to co-transform yeast cells.

COVELEDPING 10 brary using clone 15 as a probe. The CDNA has an human unbilical vein endothelial cell (HUVEC) library using clone 15 as a probe. The CDNA has an encoded protein contains a death domain, with interacts with the encoded protein contains a death domain, with interacts with the death domain of Fas. The DNA may be used in gene therapy, and the protein no a corresponding antibody may be used to screen for agents modulating FADD pathway cellular functions and Fas-associated apoptosis, for use in therapy of e.g. AIDS, inflammation, leukaemia, myocardial infarction, degenerative disease, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 81 cctagaagaagcaatgcgtcgacccccggctgtccgtgagtcccccttcgctgcgggacct 140

The present sequence encodes a human G-protein coupled receptor, designated Fishboy Enablets can be used to treat subjects in need of modulated Fishboy products can be used to treat subjects in to be treated include bacterial, protozoal, fungal and viral, particularly HIV-1 or HIV-2 infections, pain, cancers, diabetes, obesity, anorexia, bulimia, asthma, parkinson's disease, acute heart failure, hypotension, hypertension, urinary retention, osteoporosis, angina prostatic hypertrophy, migratine, vomitting, psychotic and neurological disorders and dyskinesias such as Huntington's disease or Tourette's
                                                                                                                                             Human; fishboy; G-protein coupled receptor; therapy; diagnosis; signal transduction; HIV; infection; pain; cancer; diabetes; obesity; anorexia; bulinha; asthma; Parkinson's disease; acute heart failure; hypotension; hypertension; urinary retention; stroke; osteoporosis; angina pectoris; myocadalal infarction; migraine; ulcer; allergy; benign prostatic hypertrophy; vomiting; dyskinesia; psychotic disorder; neurological disorder; Huntington's disease; Tourette's syndrome; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A new G-protein coupled receptor, Fishboy used to treat, e.g. benign
prostatic hypertrophy -
                                                                                                               Human fishboy G-protein coupled receptor encoding cDNA.

                                                  Z39042:
```

```
The specification describes antisense oligonucleotides (X52869-X55271) directed against at least 2 mRNAs selected from target genes, coding and non-coding regions of RNAs corresponding to target genes, gene initiation codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'-end and the juxta-section between coding and non-coding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Antisense oligonucleotide; multiple target; antisense treatment; impaired respiration; inflammation; lung disease; pulmonary vasoconstriction; inflammation; allergic rhinitis; acute asthma; allergy; asthma; impeded respiration; respiratory distress syndrome; pain; cystic fibrosis; pulmonary hypertension; pulmonary vasoconstriction; emphysema; chronic obstructive pulmonary visease; leukemia; lymphoma; carcinoma; colon cancer; breast cancer; lung cancer; pancreatic cancer; hepatocellular carcinoma; kidney cancer; melanoma; hepatic metastasis;

```
regions and all segments of RNAs encoding proteins associated with one or more disease, conditions or mixtures. The antisense oligonucleotides may be derived from sequences X5572-74. These multiple target conjugated from sequences X55780-271, can be used for the antisense treatment of diseases and conditions. Typical diseases and conditions are those associated with impaired respiration and inflammation, including lung diseases, pulmonary vasconstriction, inflammation, allergic rhinitis, acute asthma, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary vasconstriction, emphysema, chronic obstructive pulmonary disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g. colon cancer, breast cancer, lung cancer, paracetic cancer, hepatocallular carcinoma, kidney cancer, melanoma, hepatic metastasize to the lungs, including breast and prostate cancer.

allele

15-MAY-1997

T38913;

```
The present sequence represents allele BE3-R48 of the tandem-repeat polymorphic region of exon 3 of the B2-bradykinin receptor gene.

Two alleles have been identified, allele BE3-48R contains 48 tandem copies of repeat units with the consensus sequence rock(A)GGGCTAGAACC, while allele BE3-35R contains 35 copies.

The polymorphic sequences are useful for diagnosis (1.e. relating frequency of a polymorphism to disease occurrence) and/or treatment of myocardial infarction; coronary heart disease; cardiomyopathy; hypertension; genetically related vascular disease; sterility; infarction; asthma; allergy; altered bronchial reactivity, and acute or chronic inflammation. They can also be used to test potential drugs against such diseases and pharmaceuticals that contain angiotensin-converting enzyme inhibitors, kinin-receptor (ant)agonists
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1071 caacaaggatgtgaagattgagccgtgcgggcacctgctctgcagctgctgcctggctgc 1130

It was obtd. from Hela cells using a yeast 2-hybrid screen and 2-hybrid beta-galactosidase expression system. The cDNA can be used for prodn. of recombinant MORT-1 using transformed host cells. It can also be used to modulate the FAS-R ligand on cells carrying an FAS-R and to develop methods for the gene therapy of e.g. cancer and HIV infection.

braft entry and computer-readable sequence for [1] kindly submitted by W.Y.Langdon, 02-MAR-1989. Cas NS-1 is an acutelly transforming murine retrovirus that induces pre-be and pro-B cell lymphomas. It was generated from the ecotropic Cas-Br-W virus by sequential recombinations with endogenous retroviral sequences and a ceilular oncogene. The position of the oncogene junction was determined be in the gag gene for p10 at a position that removed the termined to be in the gag gene for p10 at a position that removed the termined be responsible for fibroblast and pre-B cell transformation. The authors call this oncogene v-cbl for Casitas B-lineage lymphoma. 1 (bases 1 to 2711)

**are represented as runs of N. The order of the pieces
is balieved to be corred N. The order of the pieces
of the gaps between them are based on estimates that have
provided by the submitter.

Submitted (11-5EP-1999) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA On May 20, 2000 this sequence version replaced gi:6996835 gi:6996719.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   NOTE: This is a 'working draft' sequence. It currently consists of 75 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the fihished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       8568: contig of 8568 bp in length 8668: gap of unknown length 13396: contig of 4728 bp in length
